

KETAMINE

Ketamine is an anesthetic that has been approved for both human and animal use in medical settings since 1970; about 90 percent of the ketamine legally sold is intended for veterinary use. Due to this fact, ketamine is a drug for which it is difficult for users to determine dosage. As it is designed primarily for large animals (horses, pigs, cows), the difference between a recreational versus a lethal/deadly dose is small. Ketamine can be injected or snorted. Ketamine is also known as ***special K*** or ***vitamin K***.

Certain doses of ketamine can cause dream-like states and hallucinations. In high doses, ketamine can cause delirium, amnesia, impaired motor function, high blood pressure, depression, and potentially fatal respiratory problems.
